

(a) Off-center check:  $S_{\text{obs}}^{\text{exact}}$  vs.  $\hat{S} = \frac{1}{2}\varepsilon^2 v^\top I(\theta^*)v$   
 [Example 1, random  $\theta_1^* \neq 0$ , random  $(\alpha, \beta)$ ]

(b) Normalised remainder —  $O(\varepsilon^3)$  bound at  $\theta^* \neq 0$   
 [Example 1]
