

(a) Off-center check: $S_{\text{obs}}^{\text{exact}}$ vs. $\hat{S} = \frac{1}{2}\varepsilon^2 v^\top I(\theta^*)v$
 [Example 2, random $\theta_1^* \neq 0$, random (α, β, γ)]

(b) Normalised remainder — $O(\varepsilon^3)$ bound at $\theta^* \neq 0$
 [Example 2]
